

## CONTENTS

---

### **I / General information in ultrasound-guided locoregional anaesthesia**

1. Basic physical principles of ultrasound and Doppler
2. Settings of the ultrasound display
3. Acquisition and optimisation of the image
4. Puncture and hydrodissection techniques
5. Associated neurostimulation
6. Asepsis
7. Practical rules for puncture
8. Local anaesthetics and systemic toxicity

### **II / Ultrasound-guided blocks of the upper limb**

1. Neural systematisation of the upper limb
2. Recommendations for plexus blocks of the upper limbs
3. Interscalene block (ISB)
4. Supraclavicular block (SCB)
5. Axillary block (AXB)
6. Elbow block (ulnar, radial and median)
7. Wrist block (ulnar and median)

### **III / Ultrasound-guided blocks of the lower limb**

1. Neural systematisation of the lower limb
2. Recommendations for plexus blocks of the lower limb
3. Block of the femoral nerve
4. Block of the lateral cutaneous nerve of the thigh
5. Block of the saphenous nerve
6. Block of the sciatic nerve (subgluteal, midthigh and popliteal)

### **IV / Blocks of the torso**

1. TAP block and block of the abdominals
2. Paravertebral block
3. Interpectoral block
4. Ultrasound location of the spine
